BLU-FLAME® FILTERS FOR FUEL OIL & BIOHEAT®

Central Illinois Manufacturing Company has developed a new line of fuel oil filters called **Blu-Flame®**. Blu-Flame® filters consist of a state-of-the-art Synthetic Media that have been UL® tested and approved for use with bio-fuel blends (**BioHeat®**) up to B100. Our filters have proprietary components that are ideal when changing over existing tanks for use with BioHeat®. Because of the high scouring effect of BioHeat®, a high-dirt holding capacity filter is needed for the collection of contaminants caused by the bio-fuel cleaning of the tanks and piping. With this new media technology, you will see:

- **Lower pressure drop**
- **Longer life with High-Performance Synthetic Media**
- **Easier maintenance over felt and no lint migration into piping or burner**
- **Quickest change-out with fewer call-backs**

In order to form an effective seal, the gasket on a spin-on filter needs to be lubricated during installation. All Blu-flame® filters come equipped with pre-lubed gasket containing a micro-encapsulated lubricant which is released as pressure is applied. This feature will allow you to be more consistent with installation procedures, and automatically gives you the correct lubrication at time of installation.

For literature and technical information, call 888.898.7187.
